

MakeReign App Summary

Internal section marketplace, style guide, and website builder

This app helps the MakeReign team browse reusable website sections, choose curated templates, define brand styling once, assemble pages visually, and publish/share generated sites.

Plain-English Product Shape

- â€¢ A reusable section catalogue for consistent MakeReign builds.
- â€¢ A token-based style guide so brand rules apply across every section.
- â€¢ A visual builder for composing pages without starting from code.
- â€¢ A publishing path that saves page data and renders a shareable URL.

Home screen: clear entry points for library, templates, style guide, and builder.

What The App Includes

The product is organised around four main user-facing areas.

Area	Purpose
Home	Starting point for browsing sections/templates or opening the site builder.
Section Library	Catalogue of reusable website sections with filters, lifecycle status, metadata, and previews.
Templates	Full-page starting points, including Excellence Awards and Blank Site.
Style Guide	Brand token editor for colours, type, spacing, radii, cards, buttons, links, and scaling.
Builder	Canvas where users add sections, manage pages, edit content/styles, and save/publish.

Library and style guide screens: browsing structure on the left, brand controls on the right.

Architecture And Structure

This is a small monorepo. The main product lives in apps/section-marketplace, with shared UI and section primitives in packages.

```
MakeReign Monorepo
â  â  â  apps/section-marketplace
â  â  â  â  app/ Next.js routes and screens
â  â  â  â  app/api/ sections, templates, style guides, publishing
â  â  â  â  library/ source data for sections and templates
â  â  â  â  lib/ DB, filtering, token CSS helpers
â  â  â  â  db/ Neon/Postgres migrations
â  â  â  packages
â  â  â  canonical-stack section wrapper + motion runtime base
â  â  â  section-library-ui shared marketplace/builder UI
```

Core Flow

```
Start - Browse library/template - Open builder
- Add sections - Apply style guide tokens
- Edit content/styles - Save site - Share /site/[siteId]
```

Section System

15 sections are registered in seed data. 10 currently have live React implementations.

â€¢ Categories: hero, intro, carousel, testimonials, features, gallery, forms, CTA, footer, navigation.

â€¢ Tracks: stable and experimental.

â€¢ Lifecycle: Approved and Submitted.

â€¢ Unimplemented sections show as coming soon placeholders.

Read the brief

Click any element inside this section to edit its text and style.

Move up

Move down

Remove section

Builder with one hero section added to the canvas.

Builder Part	What it does
Left Sidebar	Searches and adds sections, manages pages, and chooses saved style guides.
Canvas	Shows the live page composition using real section components.
Inspector	Moves, removes, and edits the selected section or element.
Save	Sends pages, tokens, and styleGuideId to the publish API.

Data, APIs, And Current Notes

The app combines local catalogue data with database-backed saved work.

Data Type	Source
Sections/templates	Local JSON seed files and section/template folders inside library/.
Style guides	Neon/Postgres table: style_guides.
Published sites	Neon/Postgres table: sites, storing page/tokens JSON.

GET /api/sections GET /api/templates
GET /api/sections/[id] GET /api/templates/[slug]
GET /api/styleguides POST /api/styleguides
GET /api/styleguides/[id] PUT/DELETE /api/styleguides/[id]
POST /api/sites/publish GET /site/[siteId]

Current Notes

⚡ The frontend loads and the main screens render locally.

⚡ Database-backed style guide and publish routes require DATABASE_URL.

⚡ The app already demonstrates the intended library - style guide - builder - published site workflow.

⚡ The next practical work is hardening database setup and completing remaining section implementations.
